# Week 1

## Problem Discovery (Oct 6 - Oct 12)

---

1. **Tasks**

- Map 3 candidate problems within cybersecurity that you would like to explore
- List 5 target practitioners to interview for each (CISOs, SOC analysts, IT admins, security engineers, compliance officers, etc )
- Prepare an interview guide: ask about past incidents and current workarounds, not about your idea
- Do research on the global practices and solutions for your identified problems
- Find your internal connections. What connections are there within a team?

2. **Hypothesis**

Problem hypotheses for each of your 3 candidate problems: who is attacked, how often, what they do today, who feels the pain.
Which hypotheses are Validated, Invalidated or Changed?

3. **Test cards due**[1]

Test cards due: at least 3 (one per candidate problem), written before any interview.

Deliverable due end of the week
Problem shortlist (3 threat models) + interview plan with named targets
Schedule 1on1s with your business mentor and your cybersecurity mentors.

[1] The test card can be found at the end of the document.

## Test cards and learning cards

A hypothesis is a specific statement that must be true for your idea to work. Every hypothesis gets a test card before you test it and a learning card after. Keep them in your team's Hypothesis Log.

Your weekly rhythm

- Start of the week: write test cards for this week's hypotheses.
- During the week: run the tests and collect evidence from people outside your team.
- End of the week: complete a learning card for each test, update the status in your log, and show it at the weekly checkpoint.

| TEST CARD · WRITE THIS BEFORE YOU TEST | | |
|---|---|---|
| FIELD | WHAT TO WRITE | EXAMPLE |
| We believe that… | The hypothesis, in one specific and testable sentence. | *Practice managers at clinics with 5-20 staff have nobody responsible for security.* |
| To verify, we will… | The test: what you will do, and with whom. | *Interview 8 practice managers and ask who handles security incidents today.* |
| And measure… | The number you will count. | *How many managers cannot name a person responsible.* |
| We are right if… | The threshold. Set it before you test. | *At least 6 of 8 cannot name anyone.* |

# Test Card

Strategyzer

| Test Name | Deadline |
| --- | --- |
| Assigned to | Duration |

STEP 1: HYPOTHESIS

We believe that processes created with the new authoring process will be more efficient.

Critical:

STEP 2: TEST

To verify that, we will apply it for one year.

Test Cost:

Data Reliability:

STEP 3: METRIC

And measure the number of exceptions.

Time Required:

STEP 4: CRITERIA

We are right if the number of exceptions will decrease.

Complete the learning card after each test, using the same example.

| LEARNING CARD · COMPLETE THIS AFTER YOU TEST | | |
|---|---|---|
| FIELD | WHAT TO WRITE | EXAMPLE |
| We believed that… | The hypothesis, copied from the test card. | *Practice managers at clinics with 5-20 staff have nobody responsible for security.* |
| We observed… | What actually happened: facts and numbers, with the source. | *5 of 8 could not name anyone; 3 named an external IT contractor.* |
| We learned that… | What this means for the idea. | *The gap is real but smaller than assumed. Contractors are a second group of users.* |
| So we will… | Keep, change or drop the hypothesis, and say what comes next. | *Change it: test the contractor-managed segment separately.* |
